[6]Inrae, France
[7]Université Bourgogne Europe, France

Schedule

1. Overview & Methodological Context
2. Session 1 - Linked Open Terms (LOT) + Chowlk
3. Session 2 - Basic Formal Terms (BFO)
4. Questions/ Discussion
5. Coffee Break (30 m)
6. Session 3 - exTreme Design (XD)
7. Ontology Engineering and KGEs

Speakers

- **María Poveda-Villalón**, Universidad Politecnica de Madrid, Spain.
- **Anna Sofia Lippolis**, Università di Bologna, Italy & CNR, Italy
- **John Beverley**, University of Buffalo

Ontology Engineering

Ontology engineering is the discipline that investigates the principles, methods, and tools for creating and maintaining ontologies (Iqbal et al., 2013).

Today's pipeline of popular methodologies:

1. Requirements Elicitation

2. Ontology Conceptualization

3. Ontology Evaluation

Why do we need it?

Many examples of failures are known, mostly based on the following aspects:

lack of consensus

lack of interoperability

lack of formality

technological limits

Comparative Experiment

A *one-fits-all* methodology does not exist due to different requirements, data, and resources (e.g., available people). In this tutorial, you will have an overview of the following ones:

- Linked Open Terms (Poveda-Villalón et al., 2020) - 304 citations,
- eXtreme Design (Presutti et al., 2009) - 197 citation,
- Basic Formal Ontology (Otte et al., 2020) - 202 citations,
- Ontology Engineering with LLMs (Lippolis et al., 2025) - 46 citations.

Use Case - PFAS

Per-and polyfluoroalkyl substances - PFAS

- Persistent artificial molecules
- Exposing significant risks to human health

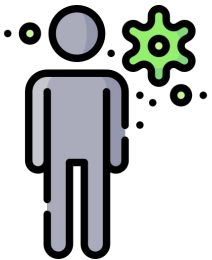
Chemistry

Exposure



Measurements

What is PDH (**P**FAS **D**ATA **H**UB)?

PFAS DATA HUB **French platform dedicated to environmental data**

Centralizes heterogeneous pollution resources

- **Scientific papers**
- **Technical reports**
- **Government documents**
- **Environmental observations**

· https://pdh.cnrs.fr/en/

Why is PDH useful for PFAS?

Scattered Knowledge

PFAS knowledge is currently scattered across many different sources.

Multiple Formats

Data exists in various forms: PDFs, technical reports, and measurements.

Complex Analysis

Manual analysis of these diverse sources is difficult and time-consuming.

PDH Solution

PDH effectively aggregates and centralizes all relevant information.

What information can we extract?

Entities

- PFAS compounds
- Locations
- Measurements

Health & Regs

- Health effects
- Regulations

Relations

- “Contaminates”
- “Detected_in”
- “Causes”

PDH Entities

Chemical entities:

PFAS compounds (PFOA, PFOS, GenX) , Other pollutants

Environmental entities:

Rivers, lakes, groundwater, Industrial sites

Measurement entities:

Concentration values, Sampling dates

Health entities:

Toxicity effects, Bioaccumulation

Examples from PDH

“PFOA detected in groundwater near industrial area”

Entity: PFOA

Location: groundwater

Relation: “detected_in”

“PFOS concentration exceeded regulatory threshold”

Entity: PFOS

Measurement: concentration value

Relation: “exceeds_threshold”

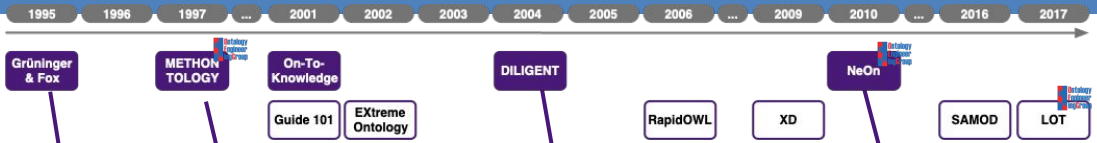
Same Data Different Model tutorial ESWC2026

María Poveda Villalón, Ontology Engineering Group
Universidad Politécnica de Madrid, Spain
[mpoveda@fi.upm.es].

10th June 2026

This work was supported by the grant “SOEL: Supporting Ontology Engineering with Large Language Models” PID2023-152703NA-I00 funded by MCIN/AEI/10.13039/501100011033 and by ``ERDF/UE''.



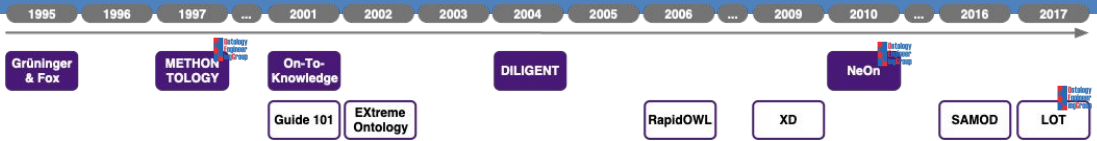
- Competency Questions technique

- Intermediate representations
- Activities identification and definition
- Activities organization

- Best practices
- Lightweight
- Common problems addressed
- Frames oriented… but still applicable

- Collaborative process
- Local adaptations

- 9 Scenarios
- Activity templates
- Guidelines for: specification, ontology reuse, NOR reuse, ODP reuse, scheduling, etc.



- Towards lightweight and agile processes
- Inspiration from software development practices
- Coupling Software and ontology development

Slide taken from “Trendy Practices and Tools in Ontological Engineering” by Dr. María Poveda Villalón

h Qualifier Key:

B	COMPOUND IS FOUND IN THE ASSOCIATED METHOD BLANK (ORGANIC) OR THE REPORTED VALUE WAS LESS T THE REPORTING LIMIT BUT GREATER THAN OR EQUAL TO THE INSTRUMENT DETECTION LIMIT (INORGANIC).
B*	COMPOUND IS FOUND IN THE ASSOCIATED METHOD BLANK (ORGANIC) OR THE REPORTED VALUE WAS LESS T THE REPORTING LIMIT BUT GREATER THAN OR EQUAL TO THE INSTRUMENT DETECTION LIMIT (INORGANIC) AN QC RESULTS ARE NOT WITHIN CONTROL LIMITS.
D	SAMPLE RESULT THAT REQUIRED DILUTION.
E	REPORTED VALUE IS ESTIMATED DUE TO PRESENCE OF INTERFERENCE (INORGANIC) OR COMPOUND EXCEEDE UPPER LEVEL OF CALIBRATION RANGE (ORGANIC).
EMPC	PEAK DETECTED, BUT DID NOT MEET QUANTIFICATION CRITERIA, RESULT REPORTED REPRESENTS THE ESTIMA MAXIMUM POSSIBLE CONCENTRATION.
J	ASSOCIATED VALUE IS ESTIMATED - MAY BE DUE TO FACTORS SUCH AS HOLDING TIME VIOLATIONS, BLANK CONTAMINATION, ETC.
J*	ASSOCIATED VALUE IS ESTIMATED AND QC RESULTS NOT WITHIN CONTROL LIMITS.
JB	ASSOCIATED VALUE IS AN ESTIMATE, COMPOUND IS FOUND IN THE ASSOCIATED METHOD BLANK.
LQV	LAB QUALIFIED, UNDEFINED. DATA SUBSEQUENTLY VALIDATED.
T	ANALYTE RECALCULATED AGAINST ALTERNATE LABELED COMPOUND(S) OR INTERNAL STANDARD.
U	NOT DETECTED ABOVE THE ASSOCIATED QUANTITATION LIMIT.
UJ	NOT DETECTED ABOVE THE ASSOCIATED QUANTITATION LIMIT AND ESTIMATED DUE TO VARIOUS QC DEVIATIO INCLUDING ELEVATED OR ESTIMATED QUANTITATION LIMIT.
UT	NOT DETECTED ABOVE THE ASSOCIATED QUANTITATION LIMIT; AND ANALYTE RECALCULATED AGAINST ALTER LABELED COMPOUND(S) OR INTERNAL STANDARD.
*	QC RESULTS NOT WITHIN CONTROL LIMITS.

Following Competency Questions/Natural language statements techniques

- A **sample record** shall be associated with a current **site name**
- A **site** shall have a textual **identifier** or **name**
- A **site** can be **located** within a **town**
- A town is a **geographic administrative entity**
- Multiple **sample records** can belong to the same **site**
- A **sample** shall be associated with a sample **point sequence identifier**
- A sample **point sequence identifier** shall include one **measurement** per **parameter**
- The possible **parameters** are: HFPO-DA_A, PFODA_A, PFOS_A, PFUNDA_A, N-MeFOSAA, PFPEA_A, PFPES_A, 6:2 FTS_A, N-EtFOSAA, PFHXA_A, PFDOA_A, PFOA_A, PFDA_A, PFDS_A, PFHXS_A, PFBA_A, PFBS_A, PFHPA_A, PFHPS_A, PFNA_A, PFTEA_A, 8:2 FTS_A, PFHXDA_A, PFNS_A, PFTRIA_A, PFOSA, 4:2 FTS_A, ADONA_A, PFOA + PFOS and SUM OF 6 PFAS
- A sample shall have a sample **date** that represents the time at which the sample was collected
- A sample shall have a **sample type**
- The possible **sample types** are: AS, BC, BD, BM, CO, DW, E, FE, FA, FR, GR, GW, L, LG, LV, MA, MEA, MLK, MU and N
- An analytical result shall have a **concentration value**
- Concentration values can be associated with **measurement units**
- An analytical result can optionally have a **laboratory qualifier**
- The possible **laboratory qualifiers** are: B, B*, D, E, EMPC, J, J*, JB, LQV, T, U, UJ, UT and *

Erroneous domain definitions #38
Closed
vcharpenay opened this issue on Jun 12, 2017 · 2 comments
vcharpenay commented on Jun 12, 2017
Some domain axioms seem erroneous:
:providesInteractionPattern rdfs:domain :InteractionPattern . I suppose you mean rdfs:range ?
:name rdfs:domain :Thing leads to the fact that all interaction patterns are also things, which is unwanted, I guess.
In general, are domain/range axioms supposed to remain in the ontology or will they eventually be removed?
mariapoveda commented on Jun 12, 2017
Owner
Thanks for the comments I'll update the ontology.
I'd rather to keep them in the ontology.

- Theory of BFO
- Building Ontologies with BFO

Information Silos

An *information silo* is an information repository, e.g. management system, database, the content of which cannot be integrated with that of other information repositories using standard computing strategies

Interoperability Strategies

- For the sake of argument, let us call "interoperability strategies" those strategies that mitigate or eliminate information silos

- Interoperability strategies may be divided along at least three axes

Machine-Machine
Human-Human
Human-Machine

Machine-Machine Interoperability

- Involves addressing the more familiar information silos

- Associated interoperability strategies often emphasize common metadata standards, business logic, APIs, etc.

Any two heterogeneous information systems share some underlying formal structure

Human-Human Interoperability

- Involves addressing what we might call social silos, which undermine consistent communication among agents

- Human-Human Interoperability strategies often emphasize consensus-building exercises, dictionaries, evaluation of natural language, etc.

Any two speakers of a given natural language share some underlying formal structure

Human-Machine Interoperability

- Involves encoding human-human interoperable solutions in a machine-readable manner

- Associated interoperability strategies often emphasize data schemas, ontologies, knowledge graphs, etc.

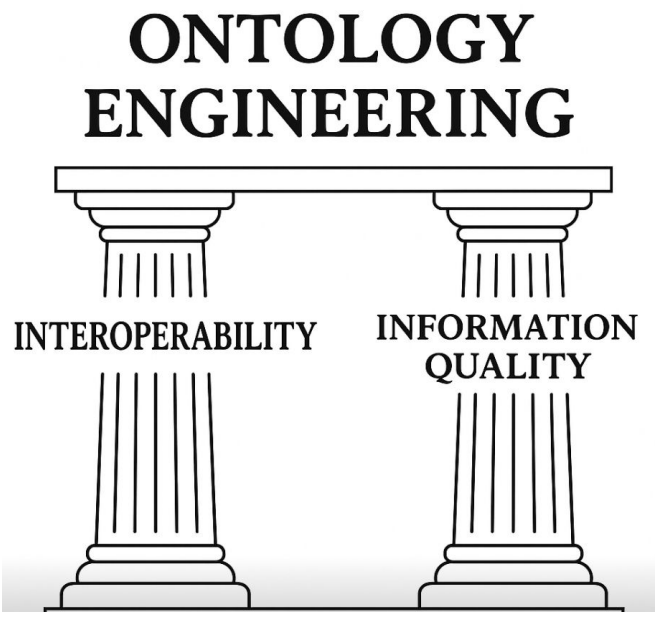
Any two heterogeneous information systems share some underlying formal structure

Promise of Ontology Engineering

- Ontologies are formally well-defined machine-interpretable controlled vocabularies designed to represent entities and logical relationships among them

- Ontologies make **explicit** the **implicit** meanings buried in datasets, by using basic principles of formal logic

- Ontologies provide a **semantic layer** to connect information silos



ONTOLOGY
ENGINEERING
INTEROPERABILITY
INFORMATION
QUALITY

ONTOLOGY ENGINEERING IS A DISCIPLINE FOCUSED ON STRATEGIES THAT SIMULTANEOUSLY ADDRESS INFORMATION SILOS AND IMPROVE INFORMATION QUALITY

Connection between Pillars

- Too much **emphasis on interoperability** leads to ontology artifacts that lack the the rich axiomatization needed to leverage tools to support information quality improvement

- Too much **emphasis on the information quality** results in information silos, unable to leverage common semantics in computing systems to promote interoperability

Best Practices

- Pursuing **interoperability** and **information quality** simultaneously can be pursued by adopting common best practices in our community

- Many of which are shared with the software development community, such as having a **top-level ontology**, adopting **modularization**, and so on

Outline

- Motivation for Ontology Engineering

MEMORANDUM FOR CHIEF DIGITAL AND ARTIFICIAL INTELLIGENCE OFFICER COUNCIL MEMBERS
INTELLIGENCE COMMUNITY CHIEF DATA OFFICER COUNCIL MEMBERS

SUBJECT: Baseline Standards for Formal Ontology within the Department of Defense and the Intelligence Community

In April 2023, the Chief Digital and Artificial Intelligence Officer Council and the Intelligence Community Chief Data Officer Council chartered the joint Department of Defense (DoD) and Intelligence Community (IC) Ontology Working Group (DIOWG). It was tasked with developing coordinated ontologies to set the agreed definitions and standard necessary to make data machine understandable. Based on the DIOWG's recommendations, both Councils direct the use of three baselines: Top-Level Ontology, Basic Formal Ontology, and Common Core Ontology. These will set the baseline standards for formal DoD and IC ontology.

By aligning the DoD and IC ontologies to a common set of top and mid-level standards, the combined enterprise will realize significant gains in data interoperability, federated search and discovery, decreased analytic timelines, and better cost efficiency. This common approach to data ontology is key to deriving value from shared data assets at speed and scale. The DIOWG has provided additional background information on these international ontological standards in Attachment A.

The nation's warfighters and intelligence professionals will need to have a decisional advantage in the immediate future and that can only be unlocked through the sharing of interoperable data. The next steps for the DIOWG are to codify recommended principles and governance processes to manage the DoD-IC Ontology Foundry. The DIOWG collaboration site can be accessed by visiting https://www.trmc.osd.mil/wiki/display/DIOWG/.

DoD-IC Enterprise Standards Baseline

Standards Citations for ISO 21838: Parts 1 and 2

Joint Enterprise Standards Committee (JESC) Plenary was held 23 Oct 2024 . DoD IT Standards Registry (DISR) 24-2.0 (i.e., the DoD-IC joint enterprise standards baseline) was published 07 Nov 2024 . The baseline includes the two Change Requests (CRs) for TLO and BFO. Congratulations all and thank you!

DISR 24-2 Baseline (published on 7 Nov 2024) Includes Entries for ISO/IEC 21838 Parts 1 and 2. Their citations are below:

Standard Reference Number	303330	303321
Standard Identifier	ISO/IEC 21838-1:2021	ISO/IEC 21838-2:2021

Joint Enterprise Standards Committee (JESC) Applications Technical Working Group

About JESC

The JESC serves as the governance body for DoD information technology (IT) standards, and for Intelligence Community (IC) enterprise standards. These include data standards critical to the ADL Initiative's development of a Total Learning Architecture (TLA) for DoD education and training.

The JESC, which includes subordinate committees, working groups, and ad-hoc enterprise standards activities, recommends common enterprise standards, profiles, and specifications for DoD and IC information environments. Standards approved by this committee are mandated by DoD's Chief Information Officer for Department-wide use and acquisitions.

Methodological Convictions

- **Realism** – BFO is designed to represent the world, rather than simply concepts about the world
- **Hub & Spoke** – BFO is a hub from which spoke ontologies extend
- **Fallibilism** – BFO is committed to tracking scientific research over time, which might change
- **Adequatism** – BFO is non-reductive, classes and relations motivated by research communities are not 'paraphrased away' for example

Methodological Convictions

- **Realism** – BFO is designed to represent the world, rather than simply concepts about the world
- **Hub & Spoke** – BFO is a hub from which spoke ontologies extend
- **Fallibilism** – BFO is committed to tracking scientific research over time, which might change
- **Adequatism** – BFO is non-reductive, classes and relations motivated by research communities are not 'paraphrased away' for example

Realism

If we attempt to go from the words we use to the world, it is unlikely that we will end up in the same place

If we attempt to go from the world to the words we use, it is more likely we will remain coordinated

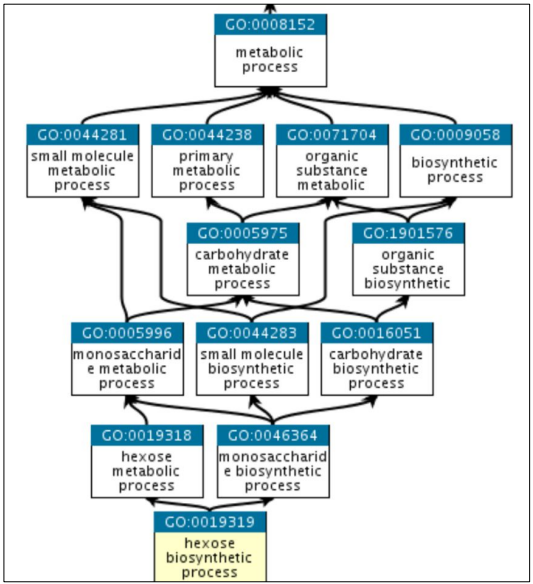
Methodological Convictions

- **Realism** – BFO is designed to represent the world, rather than simply concepts about the world
- **Hub & Spoke** – BFO is a hub from which spoke ontologies extend
- **Fallibilism** – BFO is committed to tracking scientific research over time, which might change
- **Adequatism** – BFO is non-reductive, classes and relations motivated by research communities are not 'paraphrased away' for example

Gene Ontology - 1998

GENEONTOLOGY
Unifying Biology

The mission of the GO Consortium is to develop a comprehensive, **computational model of biological systems**, ranging from the molecular to the organism level, across the multiplicity of species in the tree of life.



Proliferation of Ontologies

- When developed correctly, ontologies provide **common vocabularies** with **common semantics** across **multiple domains**
- The success of the Gene Ontology led to a proliferation of ontologies developed by subject-matter experts, computer scientists, and logicians
- Almost **none** of which were developed in coordination
- The result was **massive incompatibility** of terms and relations, confusion, in-fighting, name-calling, etc.

Open Biological and Biomedical Ontologies

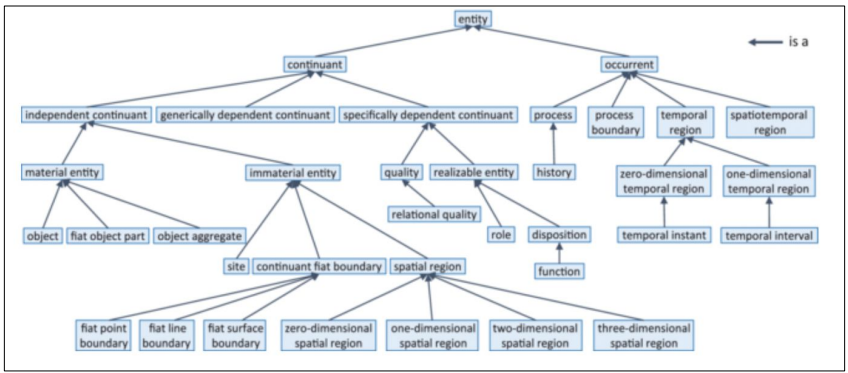
- In 2005, a consortium of biologists decided to create standards for ontology development

- Such as requiring ontologies be open-source, have documentation, include definitions for vocabulary terms **and...**

- **Align to a top-level ontology which provides a starting point for all ontology development...**

Basic Formal Ontology

BFO is such a standard, used by over 700 open-source groups, the first ISO/IEC top-level ontology standard, and a "baseline standard" for DOD-IC ontology development



python™ *Analogy*

- BFO is analogous to the **Python programming language**; extensions of BFO are analogous to **Python libraries**
- You **could** create code that allows you to interact with, say, dataframes or you could **instead** start with Python and import a library like Pandas
- You **could** create ontology elements that allow you to model artifacts and processes or you **could** instead start with BFO and import an extension

‘Foundry’ Efforts

Open Biological and

Industrial Ontologies Foundry

DOD-IC Foundry

Hub & Spoke

Ontologies extending from BFO are modules in a larger hub & spoke structure

Ontologies are extended by **downward population**, new classes have parent classes in a hierarchy ultimately leading to a BFO class

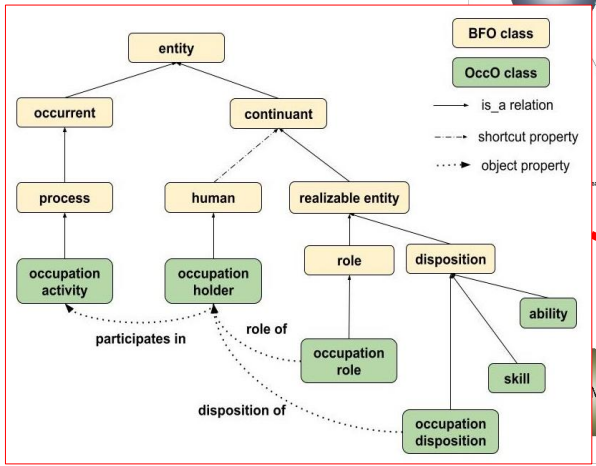
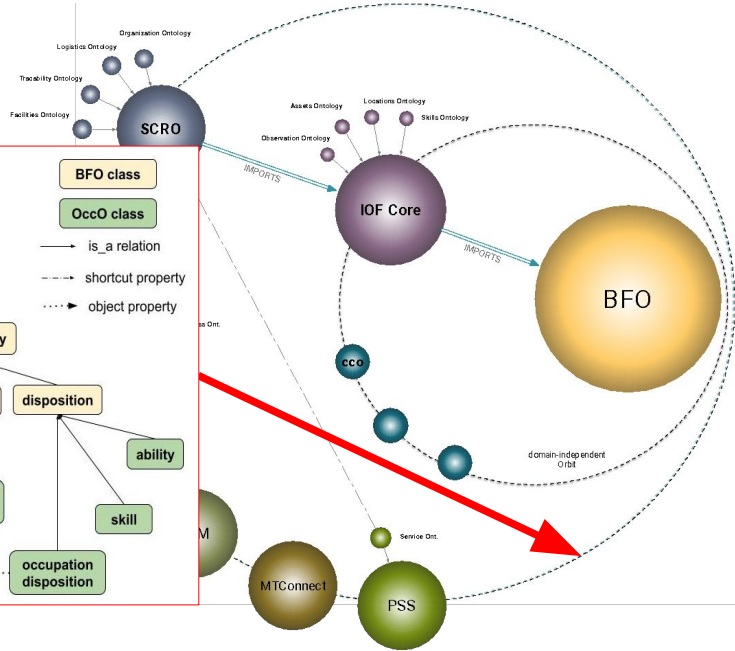
The Occupation Ontology





51 jobs that don't exist anymore

Some of these jobs have transformed into new roles with new titles due to technological advances, while others are now common colloquial terms despite disappearing as actual jobs. Here are 51 jobs that are no longer around:

1. Leech collector

A leech collector was responsible for retrieving the blood-sucking worms from their natural habitat for doctors to use. Individuals with this job used the legs of animals or their own legs to lure leeches from creeks and rivers.

2. Knocker upper

Knocker uppers, or knocker-ups, were responsible for waking people up by making loud noises before electronic alarm clocks existed. People in the 1800s would hire these individuals to shoot peas at their windows or tap on the glass using a long pole to wake them up.

51 jobs that don't exist anymore

US SOC

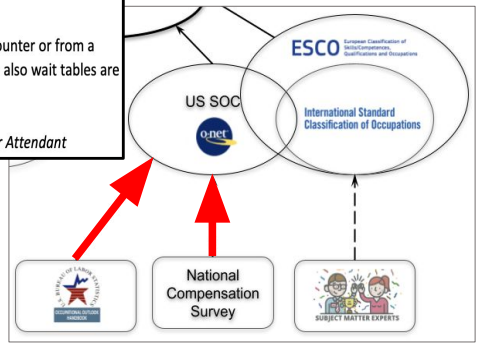
35-3020 Fast Food and Counter Workers
This broad occupation is the same as the detailed occupation:
35-3023 Fast Food and Counter Workers

35-3023 Fast Food and Counter Workers
Perform duties such as taking orders and serving food and beverages. Serve customers at counter or from a steam table. May take payment. May prepare food and beverages. Counter attendants who also wait tables are included in "Waiters and Waitresses" (35-3031),

Illustrative examples: Barista, Cafeteria Server, Ice Cream Server, Mess Attendant, Snack Bar Attendant

The National Compensation Survey and Occupation Outlook Handbook inform the development of US SOC/O*NET



Semantic Enrichment

- Ontologies designed using a top-level ontology and follow well-defined strategies for preserving semantics through extensions

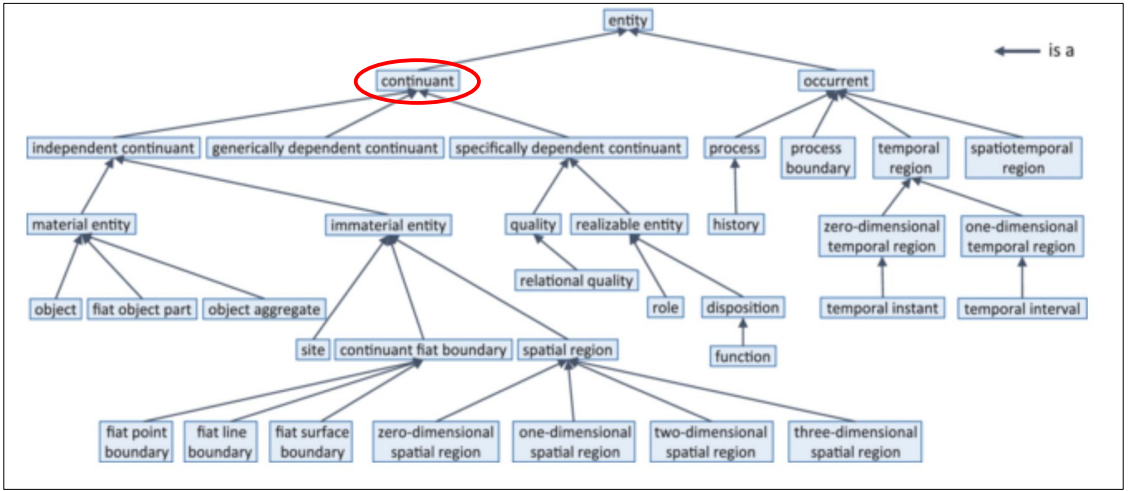
- **Exploration**, **discovery**, **prediction**, and **analysis** of enriched data can be conducted using the semantic stack and emerging semantic tooling

- All owing to rich shared semantics

Outline

- Motivation for Ontology Engineering
- Motivation for Basic Formal Ontology
- Theory of BFO
- Building Ontologies with BFO

Continuant



entity
is a
continuant
occurrent
independent continuant
generically dependent continuant
specifically dependent continuant

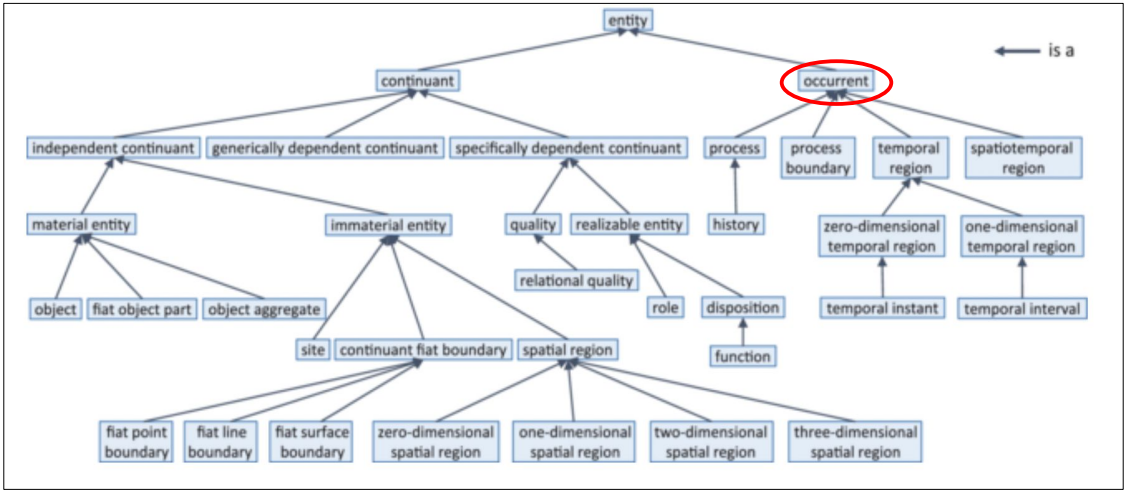
site
continuant fiat boundary
spatial region
function
fiat point boundary
fiat line boundary
fiat surface boundary
zero-dimensional spatial region
one-dimensional spatial region
two-dimensional spatial region
three-dimensional spatial region

Continuant

- Continuants exist in time, wholly present whenever they exist at all; they are entities that lack temporal parts

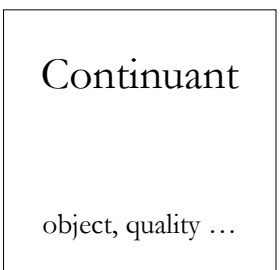
Occurrent

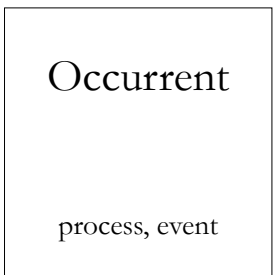


entity
is a
continuant
occurrent
independent continuant
generically dependent continuant
specifically dependent continuant
process
process boundary
temporal region
spatiotemporal region
material entity
immaterial entity
quality
realizable entity
history
zero-dimensional temporal region
one-dimensional temporal region
relational quality
object
fiat object part
object aggregate
role
disposition
temporal instant
temporal interval
site
continuant fiat boundary
spatial region
function
fiat point boundary
fiat line boundary
fiat surface boundary
zero-dimensional spatial region
one-dimensional spatial region
two-dimensional spatial region
three-dimensional spatial region

Occurrent

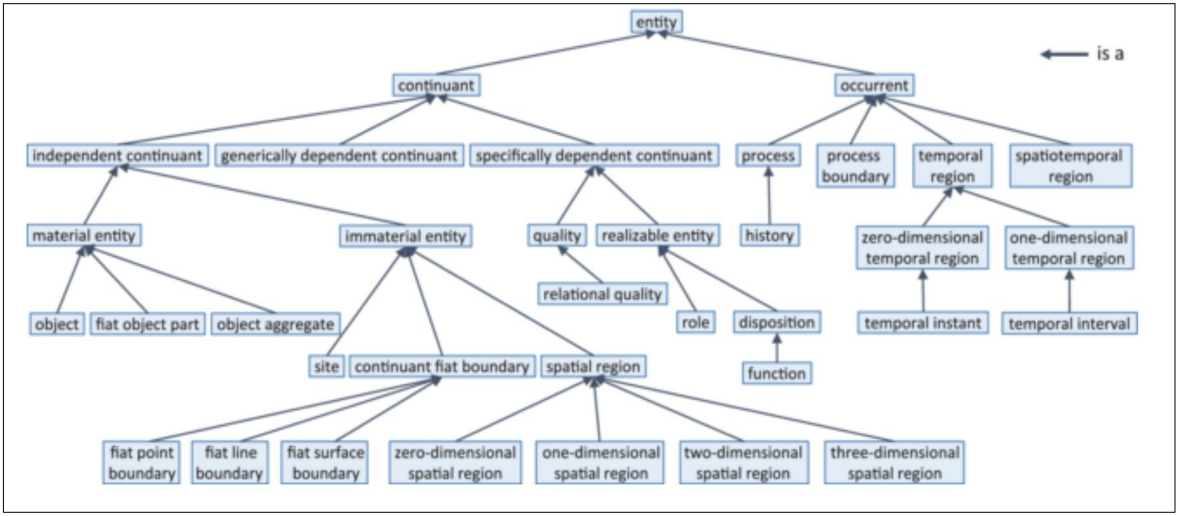
- Occurrents exist over time, in that they have temporal parts



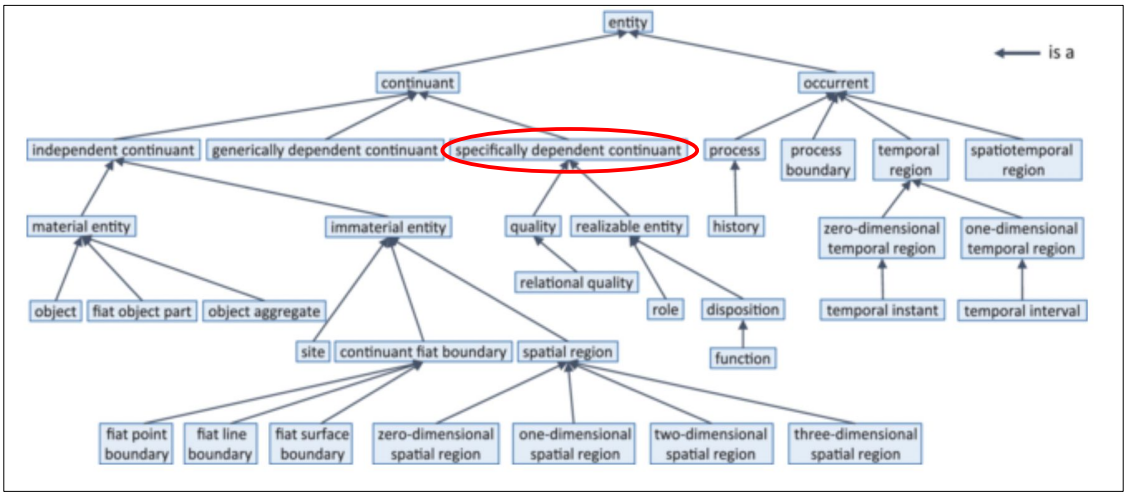


Classes represent collections of instances
For example: the class of *tables* falls under the class of *objects* and your dinner table would be an instance of the former

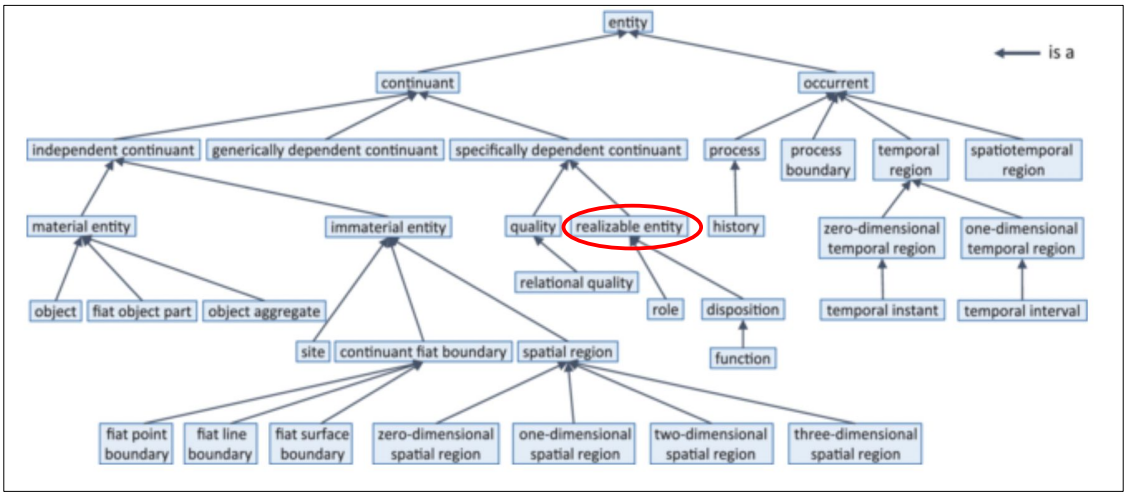
Class A *is_a* Class B means any instance of Class A is an instance of Class B



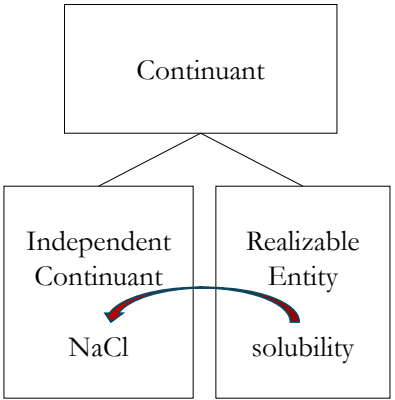
Specifically Dependent Continuant



Realizable Entity



Realizable Entity



Not all dependent entities fully manifest when they exist

Realizable Entity

- Attributes of some material bearer that only become manifest under certain conditions

- Put another way, realizable entities underwrite what bearers can do

Rule of Thumb

There is a portion of sodium chloride before you

- Suppose I ask "Does this portion exhibit a lattice structure?"
- You need only look at the salt to find an answer
- Suppose I ask "Is this portion soluble in unsaturated H_2O?"
- You cannot simply look at the salt to find an answer

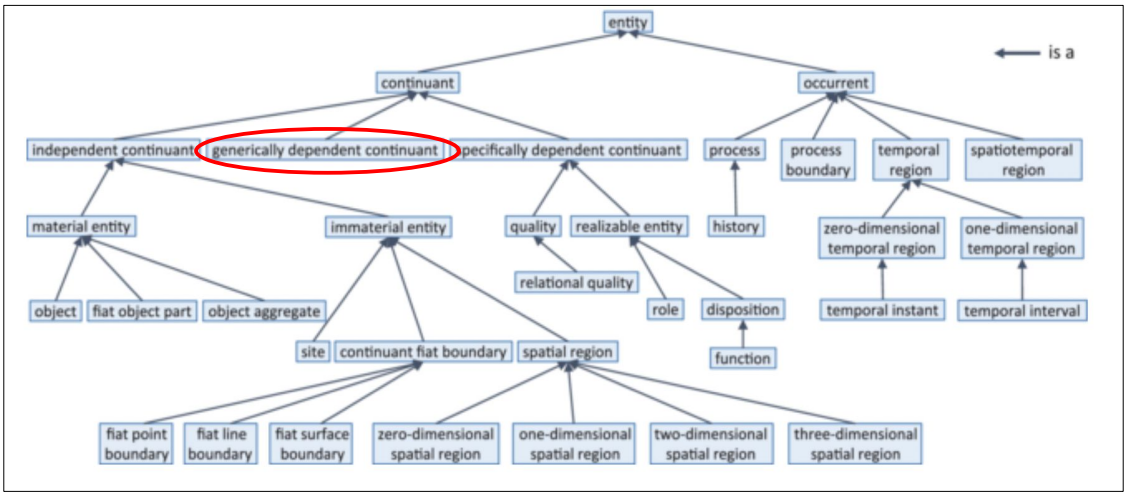
Generically Dependent Continuant



Patterns

- A need arose to represent dependent entities that could migrate across bearers

- This need led to **generically dependent continuants**, continuants that are in some sense copyable, i.e. patterns

- For example, “Snow is white” and “Schnee ist weiß” may be used to express numerically identical content, i.e. the same pattern

Real Patterns

- Some patterns are necessarily **about** something; some patterns are not
- "Snow is white" expresses content that is **about** snow
- "cm" or "." are not necessarily **about** anything; they are nevertheless patterns
- Most **generically dependent entities** represented in BFO extensions are patterns that are **about** something

Aboutness

- **Information** is a pattern that is **about** something

- In BFO extensions - such as the Information Artifact Ontology and the Information Entity Ontology - information is represented by the class **Information Content Entity**

- Where the "is about" relation is understood to be primitive:

definition [language: en]
A primitive relationship between an Information Content Entity and some Entity.

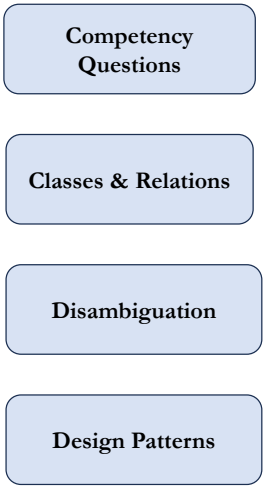
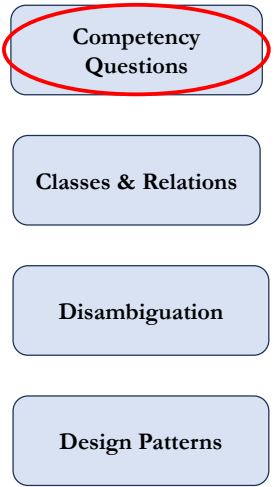
Guidance



Competency Questions
Classes & Relations
Disambiguation
Design Patterns

Guidance

- Competency questions are **used to guide ontology development** and **generate unit tests** to ensure ontologies are sufficiently well-developed
- Identify a preliminary list of competency questions **first**
- They will help you scope your project



At what speed does a patrol boat move in knots over an hour?

Classes & Relations

- Using competency questions as guidance, list the classes and relations you will need to represent to answer the questions
- Create this list through the lens of, say, Basic Formal Ontology (BFO) and/or Common Core Ontologies classes and relations
- I illustrate using BFO

Rules of Thumb

- When identifying classes, describe:

1. Material entities within scope, i.e. **Material Entity**
2. Qualities these material entities have, i.e. **Quality**
3. What these material entities could do, i.e. **Realizable Entity**
4. What these material entities actually do, i.e. **Process**
5. Where these material entities and boundaries are located, i.e. **Immaterial Entity**
6. When these entities exist, i.e. **Temporal Region**
7. Information we use to talk about 1-6, i.e. **Generically Depedent Continuant**

https://github.com/BFO-ontology/BFO-2020

Classes

- Sites & Boundaries –
- Temporal Region –
- Information – speed*, **knots measurement**

At what speed does a patrol boat move in knots over an hour?

Classes

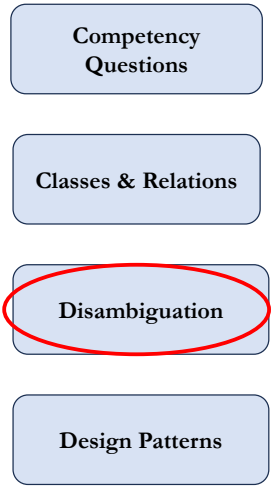
- Material Entities – Patrol boat
- Qualities –
- Processes – Act of motion, speed*
- Realizables –
- Sites & Boundaries –
- Temporal Region – **hours***
- Information – speed*, knots measurement, **hours***

use * to note ambiguity then move on; we will revisit

At what speed does a patrol boat move in knots over an hour?

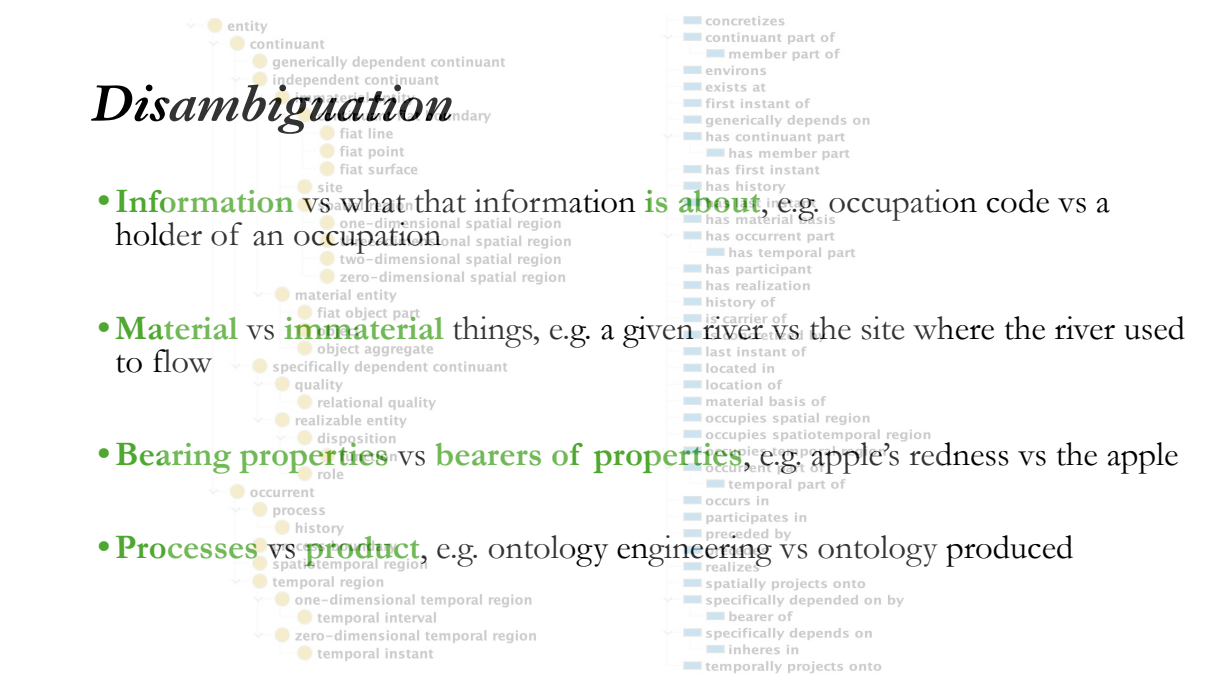
Disambiguate

- Logic is **demanding**, in part because it is **complete**
- We make explicit the implicit semantics within data, which requires disambiguating
- It is easier to stitch meaning together having cut it from whole cloth, than it is from disparate meanings



Disambiguation

- **Information** vs what that information **is about**, e.g. occupation code vs a holder of an occupation
- **Material** vs **immaterial** things, e.g. a given river vs the site where the river used to flow
- **Bearing properties** vs **bearers of properties**, e.g. apple's redness vs the apple
- **Processes** vs **product**, e.g. ontology engineering vs ontology produced



Disambiguation

- **Information** vs what that information **is about**, e.g. occupation code vs a holder of an occupation
- **Material** vs **immaterial** things, e.g. a given river vs the site where the river used to flow
- **Bearing properties** vs **bearers of properties**, e.g. apple's redness vs the apple
- **Processes** vs **product**, e.g. ontology engineering vs ontology produced

Revisiting Ambiguity

- "speed" as a process vs information about a process

Revisiting Ambiguity

- "speed" as a process vs information about a process

- Speed is the magnitude of a change in position over time

INFORMATION

Revisiting Ambiguity

- "speed" as a process vs information about a process

- Speed is the changing of position over time

PROCESS

Revisiting Ambiguity

- "speed" as a process vs information about a process

At what speed does a patrol boat move in knots over an hour?

WHICH DO WE CARE ABOUT FOR THIS COMPETENCY QUESTION?

Simplify

- Material Entities – Patrol boat
- Qualities –
- Processes – Act of motion, speed*
- Realizables –
- Sites & Boundaries –
- Temporal Region – hours*
- Information – speed*, knots measurement, hours*

At what speed does a patrol boat move in knots over an hour?

Simplify

- Material Entities – Patrol boat
- ~~Qualities –~~
- Processes – Act of motion, speed*
- ~~Realizables –~~
- ~~Sites & Boundaries –~~
- Temporal Region – hours*
- Information – ~~speed*,~~ knots measurement, ~~hours*~~

simplify the list

At what speed does a patrol boat move in knots over an hour?

Relations

- Material Entities – Patrol boat
- Processes – Act of motion, speed
- Temporal Region – hours
- Information – knots measurement

and reflect on relationships among the listed entities

At what speed does a patrol boat move in knots over an hour?

Rules of Thumb

- When identifying relations, describe:

1. Qualities to material entities, i.e. **inheres in**
2. Realizables to material entities, i.e. **inheres in**, **has material basis**
3. Processes to material entities, i.e **participates in**
4. Realizables to processes, i.e. **has realization**
5. Immaterial location of material entity, i.e. **located in**
6. When any such entities exist, i.e. **exists at**, **datatype property**
7. When any such entities carry information, e.g. **generically depends on**

https://github.com/BFO-ontology/BFO-2020

Relations

- Material Entities – **Patrol boat**
- Processes – **Act of motion**, speed
- Temporal Region – hours
- Information – knots measurement

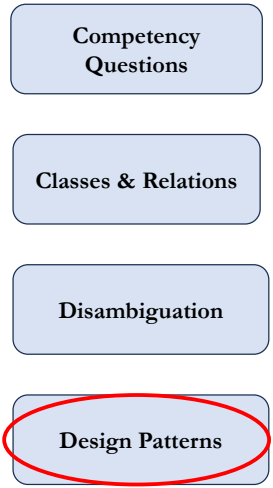
patrol boats participate in processes

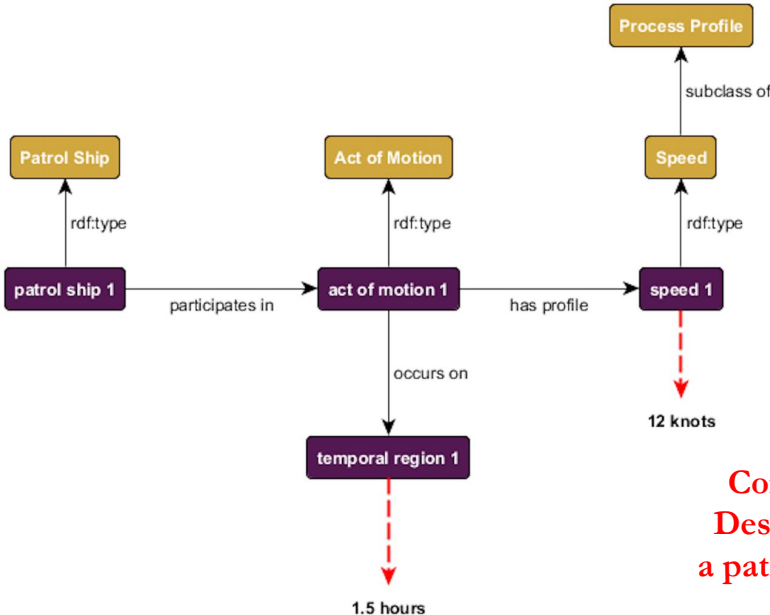
https://github.com/BFO-ontology/BFO-2020

Design Patterns

- Classes and relations identified, turn next to constructing visual representations reflecting the competency questions

- If you have completed the preceding steps, this should be relatively straightforward





Common Core Ontologies Design Pattern representing a patrol ship traveling 12 knots over 1.5 hours

CI/CD Semantic Pipeline

- Extract, normalize, and transform data into a structured format
- Using RDFlib, construct RDF graphs that conform to a design pattern
- Leverage ROBOT DevOps to verify ontology/data integrity, e.g. OWL reasoners, SPARQL, SHACL
- Leverage targeted reasoning with SPARQL to identify novel relationships
- Update design pattern with new relationships, then repeat

CI/CD Semantic Pipeline

- Extract, normalize, and transform data into a structured format
- Using RDFlib, construct RDF graphs that conform to a design pattern
- Leverage ROBOT DevOps to verify ontology/data integrity, e.g. OWL reasoners, SPARQL, SHACL
- Leverage targeted reasoning with SPARQL to identify novel relationships
- Update design pattern with new relationships, then repeat

ETL Guide: Normalizing Sensor Measurements with Pandas

Goal: Combine raw sources, such as `src/data/sensor_A.csv` and `src/data/sensor_B.json`, into a single clean CSV: `src/data/readings_normalized.csv`.

"Clean"

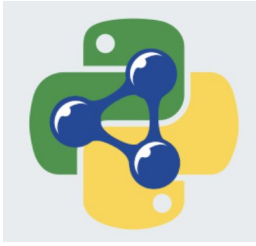
- **Consistent columns**: `artifact_id, sdc_kind, unit_label, value, timestamp`
- **Consistent datatypes**: `artifact_id|sdc_kind|unit_label` = strings; `value` = numeric; `timestamp` = ISO 8601 string (UTC preferred)
- **Consistent units**: normalize unit labels to a single spelling/abbreviation (e.g., `C` not `celsius`, `kg` not `Kilogram`)

You will write a **small Python script** (e.g., `src/scripts/normalize_readings.py`) that uses **Pandas** to load inputs, standardize, and output the normalized CSV. Use the following canonical scheme as a guide:

column	type	examples
artifact_id	str	`A-001`, `pump-42`
sdc_kind	str	`temperature`, `mass`, `length`
unit_label	str	`C`, `kg`, `m`
value	float	`23.5`, `72.0`
timestamp	str	`2025-10-16T12:00:00Z`

CI/CD Semantic Pipeline

- Extract, normalize, and transform data into a structured format
- Using RDFlib, construct RDF graphs that conform to a design pattern
- Leverage ROBOT DevOps to verify ontology/data integrity, e.g. OWL reasoners, SPARQL, SHACL
- Leverage targeted reasoning with SPARQL to identify novel relationships
- Update design pattern with new relationships, then repeat



```python
# ———————— Build graph ————————
def main():
    if not IN_CSV.exists():
        raise FileNotFoundError(f"Missing input CSV: {IN_CSV}")

    g = Graph()
    g.bind("cco", CCO)
    g.bind("bfo", BFO)
    g.bind("rdfs", RDFS)
    g.bind("xsd", XSD)
    g.bind("ex", EX)

    # Caches so we only mint each node once
    artifact_nodes = {}
    sdc_nodes = {}
    unit_nodes = {}

    with IN_CSV.open(newline="", encoding="utf-8") as fh:
        reader = csv.DictReader(fh)
        rows = list(reader)

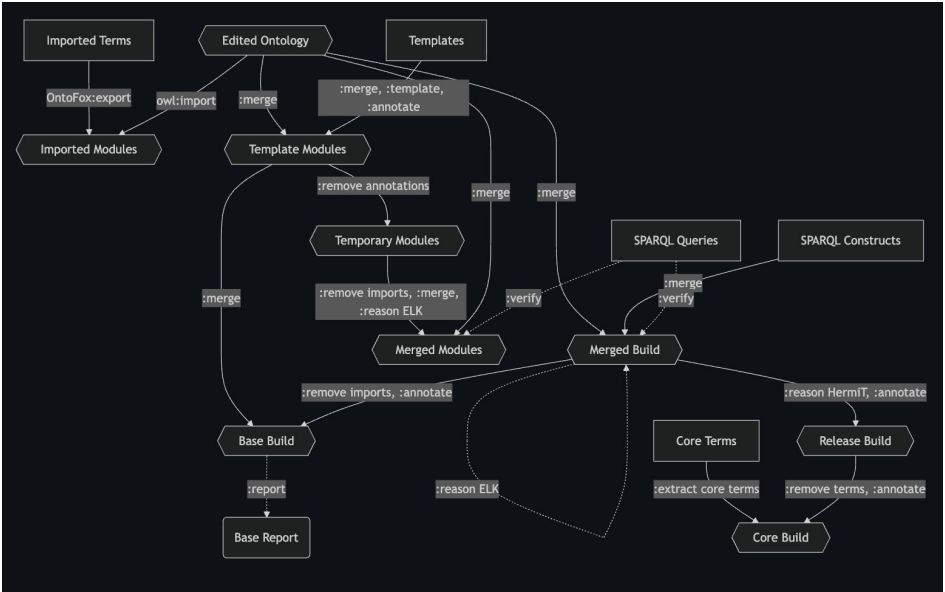
    for i, row in enumerate(rows, start=1):
        artifact_id = (row.get("artifact_id") or "").strip()
        sdc_kind    = (row.get("sdc_kind") or "").strip()
        unit_label  = (row.get("unit_label") or "").strip()
        value_str   = (row.get("value") or "").strip()
        timestamp   = (row.get("timestamp") or "").strip()

        if not (artifact_id and sdc_kind and unit_label and value_str and timestamp):
            # Skip incomplete rows (shouldn't happen if ETL enforced)
            continue
```

CI/CD Semantic Pipeline

- Extract, normalize, and transform data into a structured format
- Using RDFlib, construct RDF graphs that conform to a design pattern
- Leverage ROBOT DevOps to verify ontology/data integrity, e.g. OWL reasoners, SPARQL, SHACL
- Leverage targeted reasoning with SPARQL to identify novel relationships
- Update design pattern with new relationships, then repeat

ROBOT ROBOT is an OBO Tool



CI/CD Semantic Pipeline

- Extract, normalize, and transform data into a structured format
- Using RDFlib, construct RDF graphs that conform to a design pattern
- Leverage ROBOT DevOps to verify ontology/data integrity, e.g. OWL reasoners, SPARQL, SHACL
- Leverage targeted reasoning with SPARQL to identify novel relationships
- Update design pattern with new relationships, then repeat

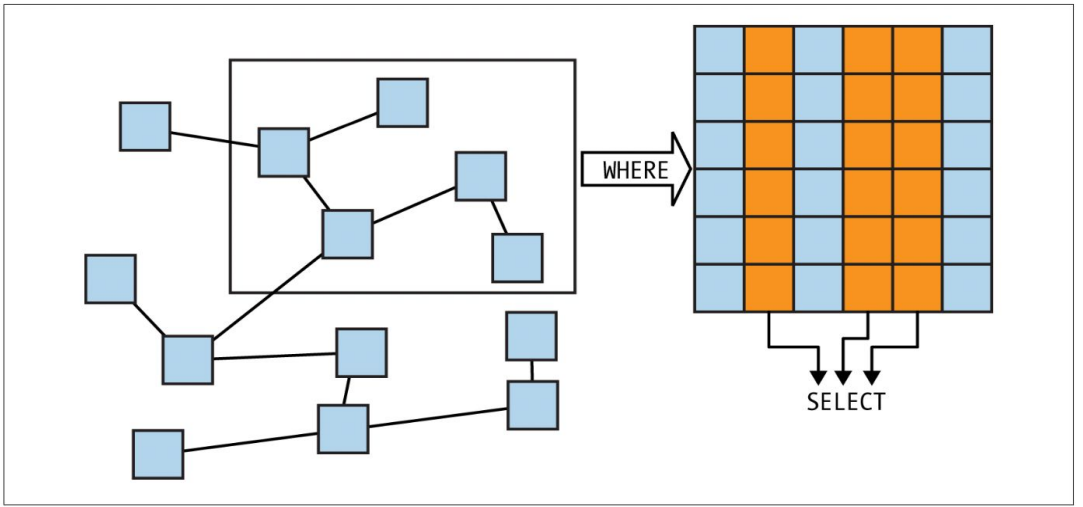


Figure 1-1. WHERE specifies data to pull out; SELECT picks which data to display

CI/CD Semantic Pipeline

- Extract, normalize, and transform data into a structured format
- Using RDFlib, construct RDF graphs that conform to a design pattern
- Leverage ROBOT DevOps to verify ontology/data integrity, e.g. OWL reasoners, SPARQL, SHACL
- Leverage targeted reasoning with SPARQL to identify novel relationships
- Update design pattern with new relationships, then repeat

Whenever you **add one new dataset** (like `sensor_C.csv`) to the `src/data/` folder and push to GitHub, the provided workflow will automatically:

1. Run your **ETL script** to update `src/data/readings_normalized.csv`.
2. Run your **RDFlib script** to rebuild `src/measure_cco.ttl`.
3. Run **SPARQL QC** checks to verify annotation and logical consistency.
4. Run **SHACL** validation to confirm data integrity.

If everything is correct, your workflow run will show a ✅ next to each step in GitHub Actions.

```yaml
name: Ontology Workflow

on:
  push:
    paths:
      - "projects/project-4/assignment/src/data/**"

jobs:
  build-and-validate:
    runs-on: ubuntu-latest
    timeout-minutes: 15
```

```
4/assignment
```

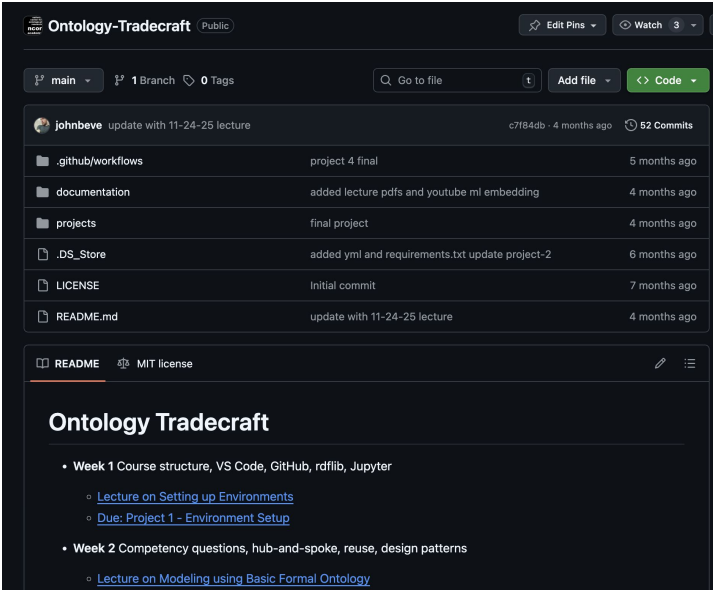
```
OJECT_ROOT }}
```

```
r diff below
```

```
ADDED file under src/data/**
```

```yaml
          id: detect
          shell: bash
          run: |
            BEFORE_SHA="${{ github.event.before }}"
            AFTER_SHA="${{ github.sha }}"

            # Handle first-push edge case
            if [[ "$BEFORE_SHA" == "0000000000000000000000000000000000000000" || -z "$BEFORE_SHA" ]]; then
              if git rev-parse HEAD^ >/dev/null 2>&1; then
                BEFORE_SHA="$(git rev-parse HEAD^)"
              else
                BEFORE_SHA="$AFTER_SHA"
```



https://github.com/Applied-Ontology-Education/Ontology-Tradecraft

WE MAKE EXPLICIT THE IMPLICIT SEMANTICS IN DATASETS, IN THE INTEREST OF ADDRESSING INTEROPERABILITY CHALLENGES AND IMPROVING DATA QUALITY VIA GENERAL AND TARGETED REASONING

Assignment

For each case, construct a BFO-conformant design pattern with justification

https://github.com/Applied-Ontology-Education/2025-C-FORS-BFO-Session

Design Pattern Guidance

- Include a legend or key
- Visually distinguish **classes** from **instances** from **strings**
- Distingish **direct relations** from **shortcuts**
- Read arrows as reflecting "any instance of class X arrow some instance of class Y"
- Carefully determine how specific/broad to make your design patterns

Submission Guidance

- Create a GitHub account and fork the **C-FORS** BFO Summer repo (see **here for GitHub** guidance)
- Save a diagram reflecting your design pattern to your forked repository in the "Submit" directory
- Save a written justification of your design pattern choices
- Open a Pull Request to the **C-FORS** repository

Case 1

In aircraft_data.xlsx you will find a row for the Airbus A320 Neo.

Construct a BFO-conformant design pattern reflecting the content of every column associated with that row.

Description
Manchester syntax rendering
Turtle rendering
Description: Airbus 320N Spec_1
Types
'is about' only ('fixed wing aircraft' and ('has continuant part' exactly 2) and ('has model FAA' value "Airbus A320 NEO") and ('has model BADA' value "Airbus A320-271N") and ('has length ft' value "123.3") and ('has tail height at OEW ft' value "39.6") and ('has manufacturer' value Airbus))

Case 2

In aircraft_data.xlsx you will find a row for the Airbus A320-111, designed to have a maximum knot approach speed of 142. However, after 5 approaches, an instance has obtained an average maximum knot approach speed of 139.

Construct a BFO-conformant design pattern reflecting the preceding phenomena.

Case 3

In soc_structure_definitions.xlsx you will find three "SOC_TITLE" entries that mention "Aerospace Engineer".

Construct a BFO-conformant design pattern that reflects all three entries and their respective "SOC Definitions".

Case 4

In employment_wage_May_2024.xlsx you will find three "OCC_TITLE" entries that mention "Aerospace Engineer".

Construct a BFO-conformant design pattern that reflects all three entries and their associated column information.

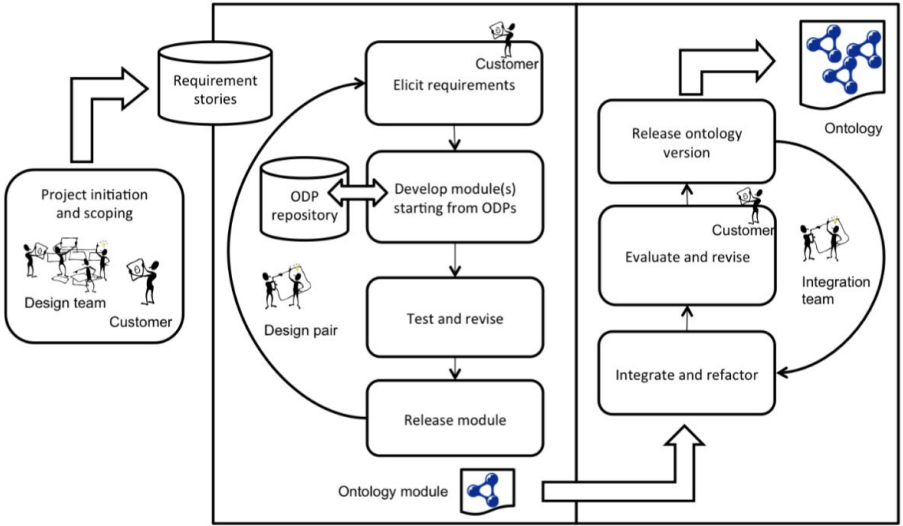
XD



STLAB
SEMANTIC TECHNOLOGY LABORATORY

Why XD (and ontology engineering) for this use case?

Data is heterogeneous, e.g. different countries use different substance names for the same chemical
Also: different matrices/units/coordinate systems

With an ontology, we can align and standardize all of these and query them efficiently!

With XD: we can reuse patterns, develop and refine quickly (iterative process), ground ourselves in requirements

STLAB
SEMANTIC TECHNOLOGY LABORATORY

Let’s see some data

Dataset, ID	Name	Category	WHY chosen
france_ades, 28	Measurement	Large authority dataset	canonical example
norway_2021_lake_Tyrifjorden, 83	Measurement	Small (109 rows)	surface waters, pfas
IT_MITENI_GW, 55	Measurement Groundwater near MITENI plant	(major Italian PFAS case)	high concentrations

The requirements (user stories)

XD starts with the customer. In XD terminology: the *customer team* is the PDH researchers, environmental scientists, and investigative journalists; the *design team* is us (the ontology engineers); and the *testing team* will later validate CQs against the ontology.

User stories:

"As a researcher, I want to know which PFAS substances were measured at a given water body and at what concentrations, so I can assess contamination severity over time."

"As a policy analyst, I want to identify which industrial sites are known or presumptive PFAS sources in a given country, so I can map regulatory exposure."

"As a journalist, I want to find all measurement points above a regulatory threshold (e.g., 100 ng/L) that are near airports or military bases, to investigate proximity between pollution sources and affected water bodies."

Good examples of user stories

Polifonia:
https://github.com/polifonia-project/stories

The requirements (Competency Questions)

CQ1: What PFAS substances were detected at a given location?

CQ2: What is the concentration of a given substance at a given sampling point, and in what unit?

CQ3: When was a given observation made?

CQ4: Which water body does a sampling point belong to?

Can you think of something else?

The requirements (Competency Questions)

CQ1: What **PFAS substances** were **detected** at a given **location**?

CQ2: What is the concentration of a given substance at a given sampling point, and in what unit?

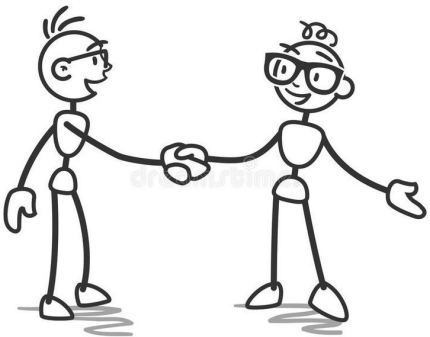
CQ3: When was a given observation made?

CQ4: Which water body does a sampling point belong to?

Can you think of something else?

Modeling for a specific domain?

Domain modeling = collaboration



Ontology Design Patterns (ODP) selection

Measurements and observations: SSN/SOSA
Quantity/parameter
Time: TimeInterval

Where? https://github.com/odpa/patterns-repository + WOP works, national works

Disadvantage: not all of them and low coverage :((*more on that later*)

ODP selection

Measurements and observations: SSN/SOSA
Quantity/parameter
Time: TimeInterval
Where?
https://github.com/odpa/patterns-repository +
WOP works

But also previous works!
See: https://github.com/whow-project

Hydrography, Water indicator, Water Monitoring
https://github.com/whow-project

STLAB
SEMANTIC TECHNOLOGY LABORATORY

Mapping cols to concepts

Dataset → dataset
Location → lat, lon
France → Country
date → date
unit → unit of measure
substance …
value …
less than …

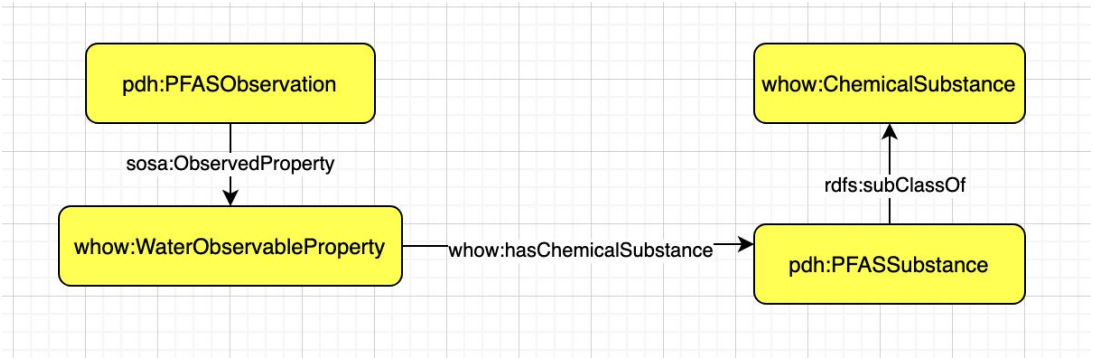
The diagram

draw.io: https://app.diagrams.net/
yEd: https://www.yworks.com/products/yed

Use the Graffoo notation

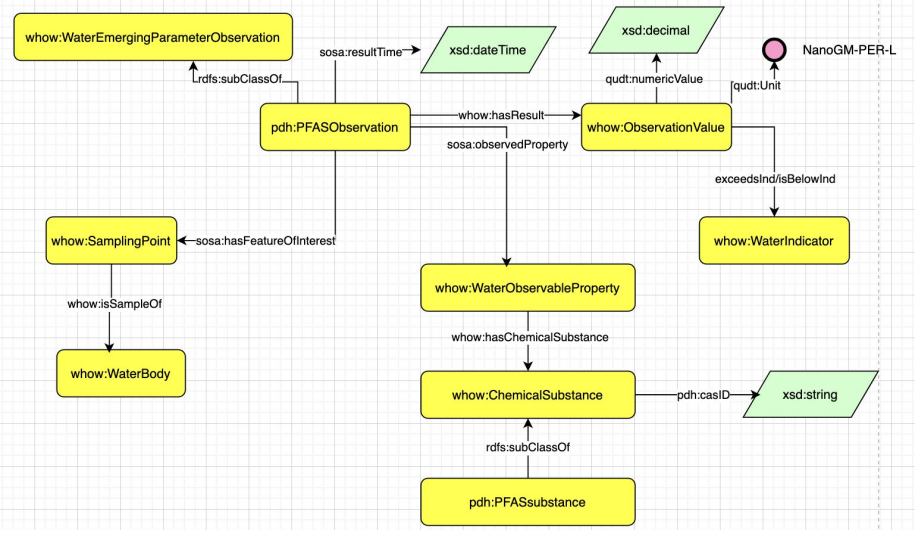
https://github.com/luigi-asprino/Graffoo4DrawIO

But also: example of modelling pattern



A `pdh:PFASObservation` observes the **concentration of a PFAS chemical substance in water** as a `whow-wm:WaterObservableProperty`, which is linked to the actual chemical, such as PFOA or PFOS, via `whow-wm:hasChemicalSubstance`.

The resulting module (Protégé)



STLAB
SEMANTIC TECHNOLOGY LABORATORY

Did it answer the CQs?

CQ1 ✅ — What PFAS substances were detected at a given location?

```
SELECT ?substance ?label WHERE {
  ?obs sosa:hasFeatureOfInterest site:tyrifjorden_S1 ;
       sosa:observedProperty ?prop .
  ?prop whow-wm:hasChemicalSubstance ?substance .
  ?substance rdfs:label ?label .
}
```

STLAB
SEMANTIC TECHNOLOGY LABORATORY

Did it answer the CQs?

CQ2 ✅ — What is the concentration of a given substance at a given sampling point, and in what unit?

```
SELECT ?value ?unit WHERE {
  ?obs sosa:hasFeatureOfInterest site:miteni_GW1 ;
       sosa:observedProperty ?prop ;
       whow-wm:hasResult ?result .
  ?prop whow-wm:hasChemicalSubstance substance:PFHxA .
  ?result qudt:numericValue ?value ;
          qudt:unit ?unit .
}
```

STLAB
SEMANTIC TECHNOLOGY LABORATORY

Did it answer the CQs?

CQ3 ✅ — When was a given observation made?

```
SELECT ?time WHERE {
  obs:france_ades_001 sosa:resultTime ?time .
}
```

Did it answer the CQs?

CQ4 ✅ — Which water body does a sampling point belong to?

```
SELECT ?wb ?label WHERE {
  site:tyrifjorden_S1 whow-wm:isSamplingPointOf ?wb .
  ?wb rdfs:label ?label .
}
```

STLAB
SEMANTIC TECHNOLOGY LABORATORY

Takeaway

CQs are used both for elicitation and for testing → their formulation is fundamental

We can reuse existing material and work in modules that we can combine for an ontology network → never reinvent the wheel if not necessary :)

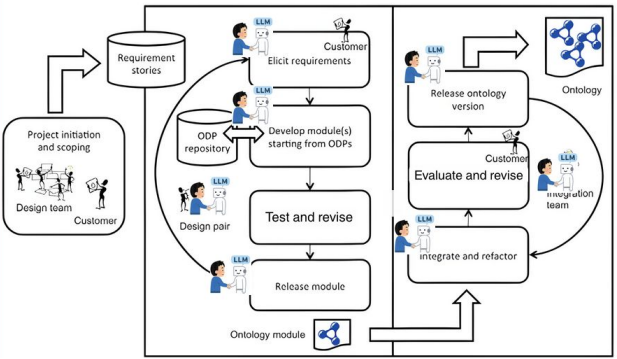
Collaboration is key (and we need consensus)

Tools are helpful!

STLAB
SEMANTIC TECHNOLOGY LABORATORY

Takeaway (ii) – challenges and open problems

- The ODP catalogue is limited and is still evolving
- Reuse requires expertise
- Still, resource consuming: What about LLMs?

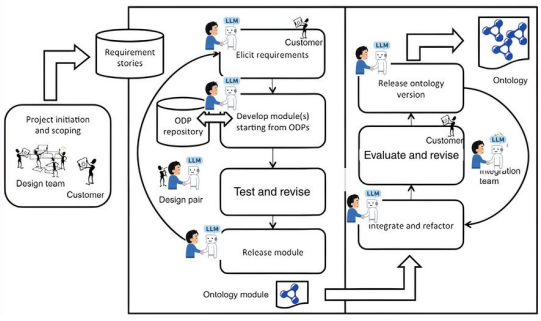


STLAB
SEMANTIC TECHNOLOGY LABORATORY

LLMs for KE

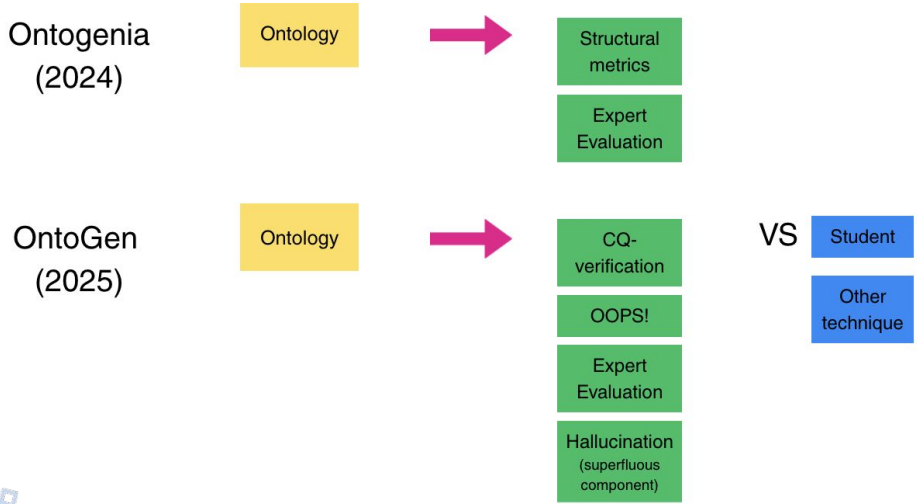
Many studies on ontology generation (&co)! From our side:

- Lippolis et al. 2024 → pilot generation with patterns
- Lippolis et al. 2025 → comparative generation on a wider dataset
- Lippolis et al. 2025b → domain-specific generation with reasoning models



The general idea is to automate the whole XD workflow. But it's challenging

LLMs for KE – evaluation



STLAB
SEMANTIC TECHNOLOGY LABORATORY

LLMs for KE (key points)

- Lack of dedicated datasets
- If data is available, data leakage risks
- Reproducibility? (see Saeedizade et al. 2025)
- Evaluation metrics? → as multidimensional as possible
- Conclusions: LLMs produce decent *drafts*, but this is not enough:
  - logical and structural issues
  - flawed when human-made requirements are flawed (propagation)
  - less comprehensive
  - less coverage (+ unnecessary, duplicate elements…)
  - no consensus (?)
  - Assistants? Automation? Human in the loop (who and how)?

Suggestions

- Reuse
- Document
- Careful with LLMs
